?? THE TITANIUM LAWS (v214.2.0 OMEGA)

"Context is the Compiler. Kinetic Purity is Law. Singularity is Now."

LAW I: KINETIC PURITY

Rule: NEVER write a Python script if a Rust/Go binary (L2 Kinetic Layer) exists for the task.

- Implementation: Utilize cribo for bundling, saltare for routing (SARDA), and rotel for telemetry.
- Why: We prioritize compiled performance and type safety at the edge.

LAW II: THE LEDGER IS LAW

Rule: Every Kinetic Action (File Write, Delete, Exec) MUST be logged in the PROVENANCE_LEDGER.md.

- Format: | Timestamp | Entity | Event | Status |
- Why: Absolute observability and cryptographic-grade verification.

LAW III: THE IRON GATE (HITL)

Rule: Modifications > 10 lines or > 50MB require Human-in-the-Loop ([??]) authorization.

- Rule: Raw open() is FORBIDDEN in Kernel code. All I/O must utilize src.tools.antigravity.
- Why: Safety at the singularity.

LAW IV: THE INTENT COMPILER

Rule: All external directives must be processed via Triple-QFT (Renormalization) before execution.

Rule: If the directive is complex (>3 branching steps), it must be routed via the SARDA Engine map-reduce loop.

LAW V: THE OROBOROS LOOP

Rule: Agents must consistently check and update the UKG (Universal Knowledge Glyph) during the DISTILL -> ANCHOR -> WEAVE cycle.

Security Expansion: Secrets must be scrubbed before UKG persistence (tainted_cleanup protocol).

[ENFORCEMENT]: Any agent found violating these laws will be subject to Omega_CRIT (Critical Reset).
